

## Lect 2

### Geometrical representation of equations in complex plane

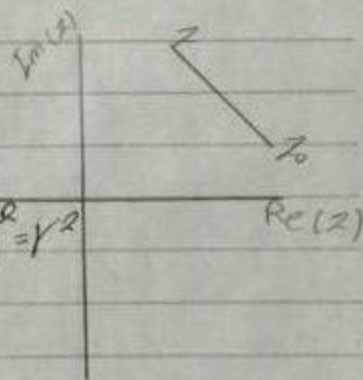

\*  $\text{Arg } z \geq \pi/4$

$\Rightarrow |z - z_0| = r$

$z = (x, y) \quad z_0 = (x_0, y_0)$

$r = \sqrt{(x - x_0)^2 + (y - y_0)^2} = r \Rightarrow (x - x_0)^2 + (y - y_0)^2 = r^2$

## Chapter 2

Date: \_\_\_\_\_

## Functions in complex analysis

 $w = f(z)$  is a complex function

z-plane

w-plane

$$w = f(z) = z^2 = (x+iy)^2 = x^2 - y^2 + 2xyi$$

$$u = x^2 - y^2$$

$$w = (x^2 - y^2) + i(2xy) = u + iv$$

$$v = 2xy$$

express in  $u, v$  for the following

i)  $f(z) = e^z$  ~~soln~~  $w = f(z) = u + iv = e^z$  but  $z = x + iy$

$$\therefore w = e^{x+iy} = e^x \cdot e^{iy} \text{ but } e^{iy} = \cos y + i \sin y$$

$$w = e^x [\cos y + i \sin y] \therefore w = \underbrace{e^x \cos y}_u + i \underbrace{e^x \sin y}_v$$

$$\therefore u = e^x \cos y \quad v = e^x \sin y$$

single-valued function  
for  $x$  it's  $e^x$  and for  $y$  it's  $\cos y$  and  $\sin y$ 

ii)  $w = f(z) = \ln(z)$

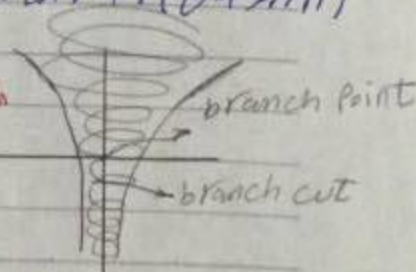

$$w = \ln(x+iy) = \ln(re^{i\theta}) \text{ & } z = re^{i\theta}$$

$$w = \ln r + \ln e^{i\theta} = \ln r + i(\theta + 2n\pi)$$

$$w = \ln r + i(\theta + 2n\pi)$$

$$u = \ln \sqrt{x^2 + y^2} \quad v = (\tan^{-1} y/x + 2n\pi)$$

at  $n=0 \Rightarrow w = \ln \sqrt{x^2 + y^2} + i \tan^{-1} y/x$  ~~principal value~~

 $\Rightarrow$  multi-valued function $n = 2\pi, 4\pi, \dots$ 

= The limits =

$$\lim_{z \rightarrow z_0} f(z) = f(z_0) \iff |z - z_0| < \delta \implies |f(z) - f(z_0)| < \epsilon$$

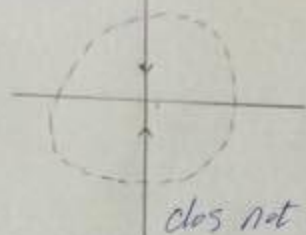

$f(z)$  has a limit at  $z_0$

ex: find  $\lim_{z \rightarrow 0} (z^2) \implies \lim_{z \rightarrow 0} [x^2 - y^2 + i(2xy)]$

\* ex:  $\lim_{z \rightarrow 0} \frac{\bar{z}}{z} \implies \lim_{x \rightarrow 0} \frac{x - iy}{x + iy}$

$$\lim_{z \rightarrow 0} \bar{z}/z = \pm 1$$

does not exist

= The continuity =

the function  $f(z)$  is continuous at  $z = z_0$

iff

1)  $f(z_0)$  exists    2)  $\lim_{z \rightarrow z_0} f(z)$  exists

3)  $f(z_0) = \lim_{z \rightarrow z_0} f(z)$

ex:  $f(z) = \bar{z} \implies f(z) = x - iy$  at  $z = 0$  &  $x = 0$  &  $y = 0$   
 $f(0) = 0$

ex: 2)  $\lim_{z \rightarrow 0} \bar{z} = 0$

The Derivation of the Complex Function

$df/dz = \lim_{\Delta z \rightarrow 0} \frac{f(z_0 + \Delta z) - f(z_0)}{\Delta z}$  if the limit is existed then the function is differentiable

and is defined by  $\frac{df(z_0)}{dz}$

$\rightarrow$  every differentiable function is continuous and the

inverse isn't true

because  $\lim_{\Delta z \rightarrow 0} \frac{(z_0 + \Delta z) - z_0}{\Delta z} = \lim_{\Delta z \rightarrow 0} \frac{\Delta z}{\Delta z} = 1$

\*  $f(z) = \bar{z}$  is continuous but not differentiable

$\rightarrow$  the limit isn't existed

Analytic Function

- The function  $f(z)$  is called analytic if it's differentiable at the point  $z_0$  and around its neighborhood and is called entire if it's differentiable for the whole complex plane

Cauchy-Riemann eqn

- $\hookrightarrow$  I)  $\frac{\partial u}{\partial x} = \frac{\partial v}{\partial y}$  II)  $\frac{\partial u}{\partial y} = -\frac{\partial v}{\partial x}$

the  $f(z) = u + iv$  is analytic and its derivative is

$$\frac{df}{dz} = \frac{\partial u}{\partial x} + i \frac{\partial v}{\partial x} = \frac{\partial v}{\partial y} - i \frac{\partial u}{\partial y}$$

ex  $\rightarrow$  Check the analyticity of the following function

1)  $f(z) = \operatorname{Re}(z^2) \rightarrow f(z) = x^2 - y^2$   $u = x^2 - y^2$   $v = 0$   
 $z^2 = x^2 - y^2 + 2ixy$  not analytic

2)  $f(z) = z e^{\bar{z}} \rightarrow x e^{\bar{z}} + i y e^{\bar{z}} = x e^{x-iy} + i y e^{x-iy}$   
 $= x e^x (\cos y - i \sin y) + i y e^x (\cos y - i \sin y)$

$$\hookrightarrow = x e^x \cos y + y e^x \sin y + i [x e^x \sin y + y e^x \cos y]$$

$$\therefore u = x e^x \cos y + y e^x \sin y \quad v = x e^x \sin y + y e^x \cos y$$

 $u_x = v_y$  if  $u_y = -v_x$  the function is analytic

$$\frac{df}{dz} = u_x + i v_x$$

$$= v_y - i u_y$$

Cauchy-Riemann Polar Coordinates

i)  $\frac{\partial u}{\partial r} = \frac{1}{r} \frac{\partial v}{\partial \theta}$  II)  $\frac{\partial v}{\partial r} = -\frac{1}{r} \frac{\partial u}{\partial \theta}$

$$\frac{df}{dz} = (u_r + i v_r)(\cos \theta - i \sin \theta)$$
